

Capital Investment Decisions and the Time Value of Money

Chapter 20

Learning Objective 1

Describe the importance of capital investments
and the capital budgeting process

Capital Budgeting

- ▶ Making capital investment decisions
- ▶ Affects operations for many years
- ▶ Requires large sums of money

Copyright (c) 2009 Prentice Hall. All rights reserved.

3

Methods of Capital Budgeting

Payback
period

Accounting
rate of
return

Net present
value

Internal rate
of return

Copyright (c) 2009 Prentice Hall. All rights reserved.

4

Focus on Cash Flows

- ▶ Operating income differs from cash flows
- ▶ Cash inflows
- ▶ Cash outflows

Copyright (c) 2009 Prentice Hall. All rights reserved.

5

Capital Budgeting Process

Copyright (c) 2009 Prentice Hall. All rights reserved.

6

Learning Objective 2

Use the payback and accounting rate of return methods to make capital investment decisions

Payback Period

- ▶ Length of time it takes to recover the cost of the capital outlay
- ▶ Measures how quickly the amount invested will be recovered
- ▶ The shorter the payback period, the more attractive the asset

Copyright (c) 2009 Prentice Hall. All rights reserved.

8

Calculating Payback Period

Equal annual net cash inflows

$$? = \frac{\text{Amount invested}}{\text{Expected annual net cash inflow}}$$

Unequal annual net cash inflows

Total net cash inflows until amount equals investment

Copyright (c) 2009 Prentice Hall. All rights reserved.

9

Criticisms of the Payback Period Method

- ▶ Focuses only on time, not profitability
- ▶ Ignores cash flows after the payback period

Copyright (c) 2009 Prentice Hall. All rights reserved.

10

Payback Period

**DECISION
RULE:**
Payback Period

?

Copyright (c) 2009 Prentice Hall. All rights reserved.

11

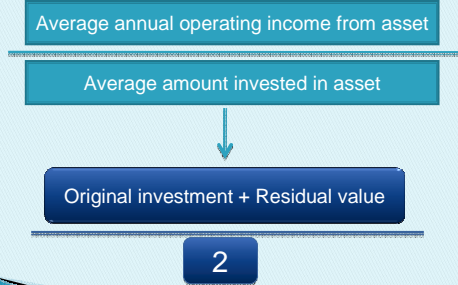

Exercise 20-15

$$\text{Payback period} = \frac{\text{Amount invested}}{\text{Expected annual net cash inflow}}$$
$$? \text{ years} = \frac{\$1,300,000}{\$314,000}$$

12

Accounting Rate of Return

Accounting Rate of Return

Objective 3

Use the time value of money to compute the present and future values of single lump sums and annuities

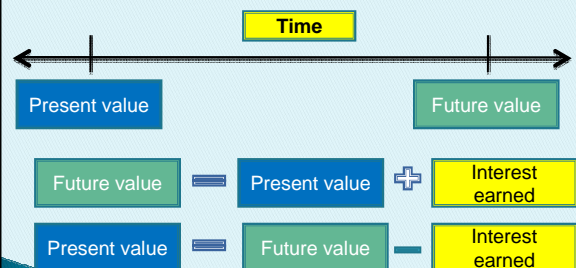

Time Value of Money

- ▶ Invested money earns income over time

Factors That Affect Time Value of Money

- ▶ Principal (p) – amount of the investment
- ▶ Number of periods (n)
- ▶ Interest rate (i) – annual percentage

Present and Future Value Along a Time Continuum

Factors for Present Value and Future Value

- ▶ Mathematical formulas developed to compute present and future values
- ▶ These factors are programmed into business calculators and spreadsheet programs

Using PV and FV factors

- ▶ Lump sum
- ▶ Annuity

Objective 4

Use discounted cash flow models to make capital investment decisions

Discounted Cash Flows Models

- ▶ Recognize time value of money
- ▶ Two methods:
 - Net present value (NPV)
 - Internal rate of return (IRR)
- ▶ Compare amount of investment with its expected net cash inflows
- ▶ Companies use present value to make the comparison

Net Present Value (NPV)

Present value of net cash inflows

Less: Investment cost

Equals: Net present value

Interest rate used is desired rate of return

The higher the risk, the ? the rate

Net Present Value

DECISION RULE: Invest in capital assets?

If NPV is **positive**

If NPV is **negative**

?

?

Equal and Unequal Cash Flows

- ▶ If investment is expected to bring in even cash flows:
 - Use Present Value of Annuity (PVA) table
- ▶ If amounts are unequal:
 - Present value of each individual cash flow is computed
 - Use Present Value of \$1 (PV) table

Exercise 20-23

| Project A | |
|-------------------------------------|------------|
| Present value of net cash inflows | |
| 57,000 x 4.639 (PVA 14%, 8 periods) | \$ 264,423 |
| Investment cost | (290,000) |
| Net present value | (?) |

Exercise 20-23 (continued)

| Project B | |
|-------------------------------------|-----------|
| Present value of net cash inflows | |
| 77,000 x 5.328 (PVA 12%, 9 periods) | \$410,256 |
| Investment cost | (380,000) |
| Net present value | ? |

Profitability Index

- ▶ Number of dollars returned for every dollar invested

Internal Rate of Return (IRR)

- ▶ Rate of return a company can expect to earn by investing in the project
- ▶ The interest rate that will cause the present value to equal zero

Computing IRR: Equal Cash Flows

Internal Rate of Return

DECISION RULE: Invest in capital assets?

If the IRR **exceeds** the required rate of return?

?

If the IRR **is less than** required rate of return?

?

Comparing Capital Budgeting Methods

Methods that **Ignore** the Time Value of Money

| Payback Period | Accounting rate of return |
|--|--|
| Simple to compute | Uses accrual accounting |
| Focuses on time it takes to recover cost of asset | Shows how investment will impact operating income, which is important to investors |
| Ignores cash flows after the payback period | Measures the profitability over the asset's life |
| Highlights risks of assets with longer cash recovery periods | |
| Ignores time value of money | Ignores time value of money |

Comparing Capital Budgeting Methods

Methods that **Incorporate** the Time Value of Money

| Net present value | Internal rate of return |
|---|--|
| Uses time value of money and asset's cash flows over its entire life | Uses time value of money and asset's cash flows over its entire life |
| Indicates whether the asset will earn the minimum required rate of return | Computes the project's unique rate of return |
| Shows excess or deficiency of asset's present value of net cash flows over its initial cost | |
| Profitability index should be computed when assets have differing investment amounts | No additional steps needed for capital rationing decisions |

End of Chapter 20
